

High-Dose Vitamin C Injections Shown To Annihilate Cancer Cells...

August 10, 2016 from Right.is

High dose vitamin C injections have shown positive results in fighting cancer cells in studies done in vitro, on mice and on humans. Peer-reviewed medical research has been recently published in the journal Science Translational Medicine that reports the findings of a team of researchers from the University of Kansas who tested the effects of vitamin C given in high doses intravenously on a group of human subjects with cancer. They found that the injections fought cancer cells yet left healthy cells well intact unlike chemotherapy. The BBC reports that vitamin C effectively targeted ovarian cancer cells while completely avoiding healthy cells. The benefits of high-dose vitamin C injections were also observed in conjunction with chemotherapy. Some are suggesting that the injections provide a great boost alongside chemo treatment. However chemo does destroy all cells, both healthy and not and is often the cause of death for cancer patients. Research on high dose vitamin C injections began in the 1970s when Dr. Linus Pauling, a chemist from Oregon State University began his research. New research involved injecting high doses of vitamin C intravenously into human ovarian cells. The tests were conducted in vitro, on mice and in 22 humans subjects. "Patients are looking for safe and low-cost choices in their management of cancer... Intravenous vitamin C has that potential based on our basic science research and early clinical data," said Dr. Jeanne Drisko, study co-author.

Researchers admit more research is unlikely because drug companies cannot patent vitamins. Generally the next step in this type of research would be creating human clinical trials that are much larger. Regardless of the fact this study is quite convincing, larger and more widespread testing would need to be done. But these types of trials cost a great deal of money. While clinical trials are often funded by large drug companies when testing out new medications, the researchers involved in this study feel drug companies won't fund such research because they can't patent the natural substance that is vitamin C. Allowing research like this could potentially destroy the multi-billion dollar cancer industry. "Because vitamin C has no patent potential, its development will not be supported by pharmaceutical companies... We believe that the time has arrived for research agencies to vigorously support thoughtful and meticulous clinical trials with intravenous vitamin C." said Qi Chen, lead author of the new study.

Conventional medicine has a hard time accepting studies like this as they would have a lot of questions to answer should they admit the validity of this research. They would have to explain why this type of knowledge has been known for decades and yet low percentage, barbaric and expensive methods like radiation and chemotherapy remain the number one method in treating cancer. This would also come with a huge loss in profit due to the fact that most proven and effective cancer treatments like this and cannabis oil are very cheap to produce. "[A]scorbate is processed by the body in different ways when administered orally versus intravenously... Oral doses [of vitamin C] act as antioxidants, protecting cells from damage caused by reactive compounds that contain oxygen. But vitamin C given intravenously can have the opposite effect by promoting the formation of one of those compounds: hydrogen peroxide. Cancer cells are particularly susceptible to damage by such reactive oxygen-containing compounds." Heidi Ledford, writer for Nature.

PS from FactorReady.com: As Dr. Andrew Saul at DoctorYourself.com often says, "Take Enough C To Be Symptom Free, Whatever That Amount Might Be." Vitamin C indeed is a very versatile and beneficial vitamin for many ailments and diseases. It reportedly even eliminates cancer "stem" cells, which are normally not destroyed by routine chemo and radiation. These are the mother cells that create the daughter cells that generate new cancers and responsible for most metastasizing spreads. Also, unlike chemo and radiation, it does not harm the good cells. Dr. Saul steadily advocates it at his web site, in his many books, and in the dvd videos such as, FoodMatters.tv, and ThatVitaminMovie.com. The vast majority of animals even make their own Vitamin C, but humans do not. God apparently intended for us to obtain this water soluble needed nutrient through appropriate foods and supplementations. The long time RDA and DV (Recommended Daily Value) for it at only 90 mg for adult males (75 mg females) is somewhat sufficient to prevent scurvy, but severely lacking in modern needed amounts for optimal health per most health authorities. And, although the natural forms of vitamins is normally preferred by many, over any synthetic lab made varieties, ascorbate acid reportedly works fine with either in the case of Vitamin C, so long as it is from a quality and pure source and process. Natural and synthetic L-ascorbic acid are both chemically identical. Our bodies are said to require 60 - 5,000 mg daily for formation of connective tissue, bones and teeth, and to assist in utilization of other vitamins, plus it acts as an antioxidant. Foods such as citrus fruits, strawberries, broccoli, melons, peppers, collards, dandelion greens, onions, radishes, watercress, all contain Vitamin C. The recommended 5 daily servings of fruits and vegetables (approx. 2.5 cups) would provide about 200 mg. For oral supplementation, Dr. Joseph Mercola at mercola.com recommends a minimum of 1000 mg daily. He prefers the Liposomal form, which reportedly provides the best and most efficient bioavailability and the most potency in an oral dose (see the offerings at LivOnLabs.com as example). Any type should be from quality and pure, non-GMO sources. The Revolution C offered at StopAgingNow.com reflects theirs contains 2 blended types (ascorbic acid and calcium ascorbate) along with BioPerine (black pepper) for increased bioavailability. Note: Smokers, the elderly and adult men will especially need sufficient Vitamin C. Intravenous (IV) type usage for serious health complications such as cancer would normally call for physician approval and their administering and monitoring. If considering or possibly needing such IV applications, read the "The Riordan IVC Protocol for Adjunctive Cancer Care Intravenous Ascorbate as a Chemotherapeutic and Biological Response Modifying Agent." It is a pdf article with considerable information to show your doctor, and may be downloaded from the available articles at DoctorYourself.com, or we can e-mail you a copy on request (or print and postal mail same). It sites some trials, suggested doses and some actual cancer cases, etc., where Vitamin C IV was utilized. It would certainly appear this is a beneficial, advantageous and affordable alternative care procedure in many cases such as cancer (especially if conventional treatments not be bringing the desired results or wish to be supplemented or avoided). Do view Dr Victor Marcial-Vega (a Medical Oncologist) input on this, as Interviewed by Dr. Saul posted on YouTube at: <https://www.youtube.com/watch?v=QDXtc-RrtFs&t=322s>. For certain too, read the articles by Dr. Thomas Levy at PeakEnergy.com concerning Vitamin C IV and/or Liposomal oral applications. Reportedly 10 grams daily of the Liposomal form has in some cases equaled benefits of up to 50 grams of ascorbic acid via IC normally apparently taken 2-3 times weekly. LivOnLabs.com is a recognized quality source for Vitamin C utilizing the Liposomal technology. Note that Liposomal may also be do it yourself home encapsulated, although not professionally recognized or approved, and would certainly lack laboratory standards in most cases. Nevertheless, certain economic cases may warrant such use, especially where IV usage not available. One web site that lists instructions is: <http://mjclive.com/healthy-living/how-to-make-your-own-liposomal-encapsulated-vitamin-c> . Plus, we post a pdf download article on same.

VITAMIN C IV USE FOR CANCER...from: Right.is...via: FactorReady.com...July 2017

Special Note: If taking conventional chemotherapy there is a form of chemo, known as "IPT" (Insulin Potentiated Therapy) that is reportedly as effective as the traditional doses with up to 90% less devastating side effects and lesser cost too, that you may wish to explore. It is offered by various medical clinics, but seemingly ignored by most of the traditional facilities. It is described in a free e-booklet at: http://www.euro-med.us/downloads/EMD_eBook.pdf.

Important Note: Any efforts to recover and/or obtain optimal health will of course require a nutritious diet. We would strongly suggest a whole food, plant-based diet such as advocated at: nutritionstudies.org (per "The China Study" book by Dr. T. Colin Campbell, and "Stop Feeding Your Cancer" by Dr. John Kelly). See our "China Study Food List" pdf Download document. Other diets of this type we are aware of include, MyHdiet.com, foodmatters.tv, RaveDiet.com and BudwigCenter.com. Also, the Phase 1 and 2 diets at knowthecause.com are helpful, especially where fungal issues involved. Any meat consumed (if any) should be the grass fed variety, with healthy wild caught fish permitted for protein. The fresh juicing of organic fruits and vegetables definitely offers a prompt way to fast obtain and retain maximum nutrition. See the versatile Samson 6-in-1 masticating juicer at SamsonJuicers.com. Note that carrots are normally heavily utilized. Their falcarinol content, mostly in the skins, is said to be very anti-cancerous, and carrots reportedly help eliminate dangerous cancer stem cells as well. See Ann Cameron's book, "Curing Cancer With Carrots" for her amazing story on this remarkable God-given vegetable. In addition, most health proponents would recommend taking a good all-natural (not synthetic) multi-vitamin with every meal, plus special anti-cancerous supplements such as Curcumin, Black Cumin seeds or oil, etc., plus some green tea and fish oil. If currently taking conventional treatments, overly weak with no appetite consider the drinkable superfood powdered meals at LivingFuel.com and special liquid immune system booster at LifeOne.org. Where Curcumin (a major component in Turmeric) is concerned, the C3 Complex, Longvida or BC-95 are considered the top 3 formulations for best bio-availability. Bio-perine (black pepper) is often used with some lesser cost formulations to assist absorbing. 1000mg daily for maintenance or 3000mg for therapy may be suggested. Also, see the special Bosmeric SR-120 proprietary formulation as found at BetterWayHealth.com. Also found there is Transfer Point 1,3D Beta Glucan, a proven and pure supplement to safely boost immune system health and efficiency. Take 1#500mg capsule per 50lbs of body weight daily on an empty stomach for therapy needs. The immune system is definitely our first line of disease and illness defense. Vitamin C, garlic and local honey can also help, and we also like the nutritional Cell Stop economical formula at optimalhealthknowledge.com/
